

Normal operation – fieldmeter showing operational health testing signal

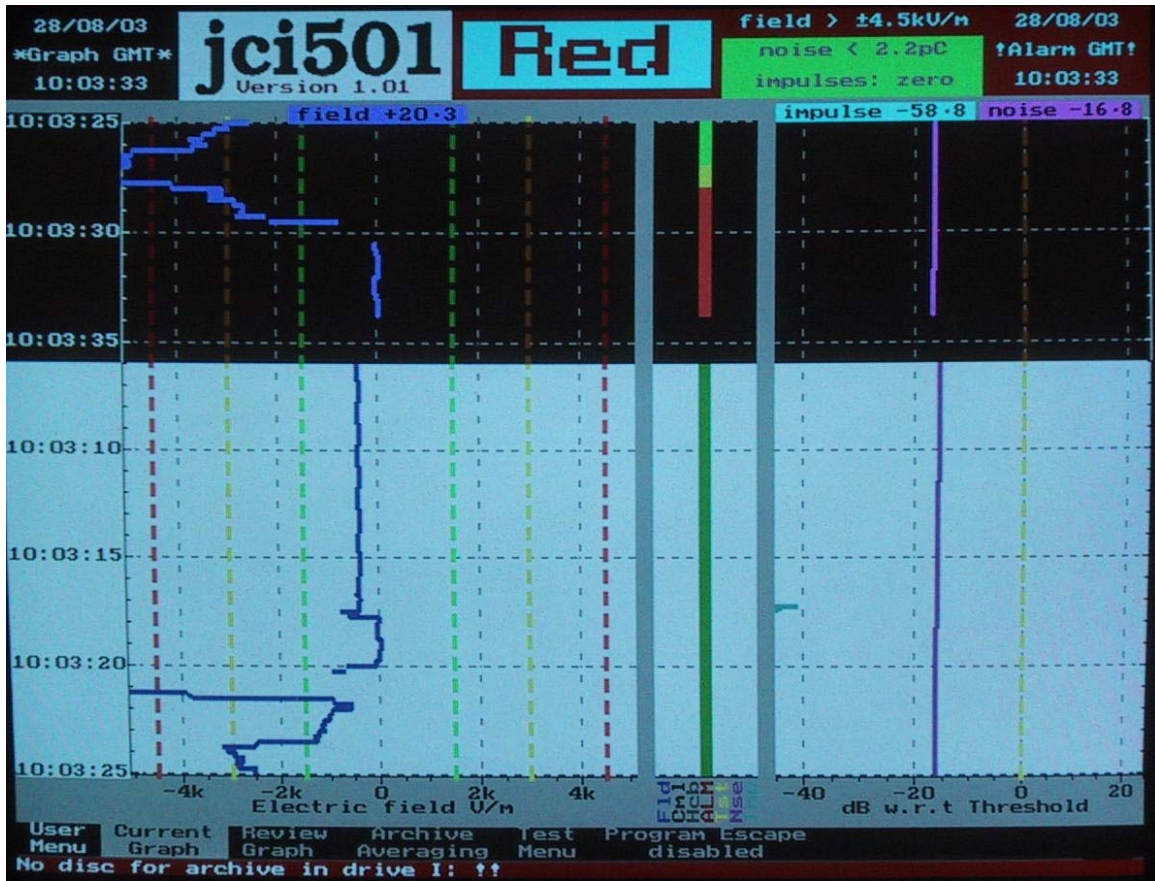

Operation with fieldmeter shielded and poor fieldmeter operational health indications

Normal operation showing response to impulse and noise signals going above threshold and giving 'amber' alert

Normal operation showing Red alert due to high noise level and two impulses above impulse threshold within 100s. Electric field low.

*Excursion of electric field above red alert threshold level*

*Operation in 'test mode' showing operational health modulation signals on noise and impulse channels and start of unsatisfactory indicator of fieldmeter health while its sensing aperture was shielded.*
